Please delete the current Abstract and substitute the following new Abstract:

Computer-implemented methods for creating an aggregate print job for simultaneous printing of multiple individual print jobs. Individual print jobs having an associated parameter identifying the size of the product to be printed are received. A number of received individual print jobs are arranged to create an aggregate print job having multiple individual print jobs in two dimensions. Aggregate print jobs may have pre-defined individual print job locations of a pre-defined size and position with which individual print jobs of are associated or may have no pre-defined individual print job sizes and positions.
